

Q.1

(c)(i) Selection of Usability Principles (core set)

The following usability principles are selected as the most important for evaluating the Digital Telephone Index UI:

Principle 1: Visibility of system status

Reason:

Users must receive immediate feedback when actions such as adding, editing or deleting a contact are performed. Without feedback, users may repeat actions or become confused.

2 (for Q2)

The Add, Edit and Delete options are consistently placed on relevant screens, which supports ease of use.

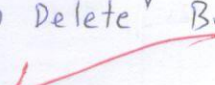

Improvement:

Ensure consistent button positioning (e.g. save on the right, cancel on the left) across all forms.

A3 (for Q3)

A confirmation dialog is shown before Deleting a contact, which prevents accidental Data loss.

Improvement:

Highlight the "confirm Delete" Button in red to clearly indicate a ~~destructive~~ destructive action. 

Principle 2: Consistency and standards

Reason:

consistent placement of Buttons (Add, Edit, Delete, Save) and familiar icons reduces the learning effort and helps user interact with the system intuitively.

Principle 3: Error Prevention

Reason:

Deleting a contact is irreversible. The interface must prevent accidental errors by providing confirmation dialogs and clear warnings

(ii) Translating Core Usability Principles into Questions

Based on the selected principles, the following evaluation questions are formed:

Q1) (Visibility of system status):

Does the system clearly inform the user when a contact is added, edited or deleted?

Q2) (consistency and standards):

Are buttons, icons, and navigation elements consistent across all screens?

Q3) (Error Prevention):

Does the system prevent accidental deletion of contacts?

(iii) Answering the Questions & Identifying Improvements

A1 (for Q1)

The system returns the user to the contact list screen after saving or updating a contact, but feedback is minimal.

Improvement

Display a confirmation message such as "contact saved successfully"
